Subject: WORK GROUP MEETING REMINDER

-----Original Message-----

From: Knight, Anthony
Sent: Tuesday, January 17, 2006 12:29 PM
To: Abdi, Aster (Chucach)
Cc: Picard, Leo; Shah, Kamini; Vincent, David
Subject: Work Group Meeting 1/30/06

We will be having a mandatory work group meeting on January 30th at 1:00 PM in the first floor conference room. Please adjust your schedules accordingly.

The SPE's of Work Group 2120

In recent years, many solutions to multi-resolution image data fusion have been proposed; however, it is difficult to simulate the human ability of image fusion when algorithms of image processing are piled up merely. On the basis of the review of researches on psychophysics and physiology of human vision, this paper presents an

effective multi-resolution image data fusion methodology, which is based on discrete wavelet transform theory and self-organizing neural network, to simulate the process ...

Recently we presented a new approach [18] to the classification problem arising in data mining. It is based on the regularization network approach but, in contrast to other methods which employ ansatz functions associated to data points, we use a grid in the usually high-dimensional feature space for the minimization process. To cope with the curse of dimensionality, we employ sparse grids [49]. Thus, only $O(hn^{-1}n^{d-1})$ instead of ...

Many different demands can be made of intrusion detection systems. An important requirement is that an intrusion detection system be effective; that is, it should detect a substantial percentage of intrusions into the supervised system, while still keeping the false alarm rate at an acceptable level. This article demonstrates that, for a reasonable set of assumptions, the false alarm rate is the limiting factor for the performance of an intrusion detection system. This is d ...

6 Special issue on special feature: Use of the zero norm with linear models and kernel methods

Jason Weston, André Elisseeff, Bernhard Schölkopf, Mike Tipping

March 2003 **The Journal of Machine Learning Research**, Volume 3

Publisher: MIT Press

Full text available:  pdf(164.22 KB) Additional Information: [full citation](#), [abstract](#), [index terms](#)

We explore the use of the so-called zero-norm of the parameters of linear models in learning. Minimization of such a quantity has many uses in a machine learning context: for variable or feature selection, minimizing training error and ensuring sparsity in solutions. We derive a simple but practical method for achieving these goals and discuss its relationship to existing techniques of minimizing the zero-norm. The method boils down to implementing a simple modification of vanilla SVM, namely vi ...

7 Data driven character animation: Style-based inverse kinematics

 [mov\(23:16 MIN\)](#)

This paper presents an inverse kinematics system based on a learned model of human poses. Given a set of constraints, our system can produce the most likely pose satisfying those constraints, in real-time. Training the model on different input data leads to different styles of IK. The model is represented as a probability distribution over the space of all possible poses. This means that our IK system can generate any pose, but prefers poses that are most similar to the space of poses in the tra ...

8 Learning one-dimensional geometric patterns under one-sided random misclassification noise

Paul W. Goldberg, Sally A. Goldman

July 1994 **Proceedings of the seventh annual conference on Computational learning theory**

Publisher: ACM Press

Full text available:  [pdf\(1.00 MB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

Developing the ability to recognize a landmark from a visual image of a robot's current location is a fundamental problem in robotics. We consider the problem of PAC-learning the concept class of geometric patterns where the target geometric pattern is a configuration of k points in the real line. Each instance is a configuration of n points on the real line, where it is labeled according to whether or not it visually resembles the target pattern.

In this paper we address the issue of using local embeddings for data visualization in two and three dimensions, and for classification. We advocate their use on the basis that they provide an efficient mapping procedure from the original dimension of the data, to a lower intrinsic dimension. We depict how they can accurately capture the user's perception of similarity in high-dimensional data for visualization purposes. Moreover, we exploit the low-dimensional mapping provided by these embeddin ...

Full text available:  [pdf\(199.32 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

Three dimensional integration is an increasingly feasible method of implementing complex

circuitry. For large circuits, which most benefit from 3-D designs, efficient placement algorithms with low time complexity are required. We present an iterative 3-D placement algorithm that places circuit elements in three dimensions in linear time. Using an order of magnitude less time, our proposed algorithm produces placements with better than 11% less wire lengths than partitioning placement using ...

Sophisticated computer graphics applications require complex models of appearance, motion, natural phenomena, and even artistic style. Such models are often difficult or impossible to design by hand. Recent research demonstrates that, instead, we can "learn" a dynamical and/or appearance model from captured data, and then synthesize realistic new data from the model. For example, we can capture the motions of a human actor and then generate new motions as they might be performed by that actor. B ...

14 Piriform (Olfactory) cortex model on the hypercube

We present a concurrent hypercube implementation of a neurophysiological model for the piriform (olfactory) cortex. The project was undertaken as the first step towards constructing a general neural network simulator on the hypercube, suitable both for applied and biological nets. The method presented here is expected to be useful for a

class of complex and computationally expensive network models with long range connectivity and non-homogeneous activity patterns. The ...

15 Feature selection, L_1 vs. L_2 regularization, and rotational invariance

Andrew Y. Ng

July 2004 **Proceedings of the twenty-first international conference on Machine learning ICML '04**

Full text available:  pdf(192.52 KB) Additional Information: [full citation](#), [abstract](#), [references](#)

We consider supervised learning in the presence of very many irrelevant features, and study two different regularization methods for preventing overfitting. Focusing on logistic regression, we show that using L_1 regularization of the parameters, the sample complexity (i.e., the number of training examples required to learn "well,") grows only *logarithmically* in the number of irrelevant features. This logarithmic rate matches the best known bounds for feature selection, a ...

16 Think globally, fit locally: unsupervised learning of low dimensional manifolds

Full text available:  pdf(2.91 MB) Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

The problem of dimensionality reduction arises in many fields of information processing, including machine learning, data compression, scientific visualization, pattern recognition, and neural computation. Here we describe locally linear embedding (LLE), an unsupervised learning algorithm that computes low dimensional, neighborhood preserving embeddings of high dimensional data. The data, assumed to be sampled from an underlying manifold, are mapped into a single global coordinate system of low ...

18 Sparse bayesian learning and the relevance vector machine

Michael E. Tipping

September 2001 **The Journal of Machine Learning Research**, Volume 1

Publisher: MIT Press

Full text available:  pdf(999.88 KB) Additional Information: [full citation](#), [abstract](#), [citations](#)

This paper introduces a general Bayesian framework for obtaining sparse solutions to regression and classification tasks utilising models linear in the parameters. Although this framework is fully general, we illustrate our approach with a particular specialisation that we denote the 'relevance vector machine' (RVM), a model of identical functional form to the popular and state-of-the-art 'support vector machine' (SVM). We demonstrate that by exploiting a probabilistic Bayesian learning framework ...

19 Session 5: novel interaction: MAUI: a multimodal affective user interface

December 2002 **Proceedings of the tenth ACM international conference on Multimedia****Publisher:** ACM PressFull text available:  pdf(377.18 KB) Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#)

Human intelligence is being increasingly redefined to include the all-encompassing effect of emotions upon what used to be considered 'pure reason'. With the recent progress of research in computer vision, speech/prosody recognition, and bio-feedback, real-time recognition of affect will enhance human-computer interaction considerably, as well as assist further progress in the development of new emotion theories. In this article, we describe how affect, moods and emotions closely interact with co ...
